

IN THE CLAIMS

Please amend the claims as follows:

Claims 1-10 (previously withdrawn).

*DI
cont'd*

Claim 11. (currently amended) ~~In an An alignment system for aligning a centerline of a first shaft with a centerline of a second shaft, the shaft alignment system including an analyzer having memory, a mounting bracket having engagement surfaces for engaging the first shaft and securing the bracket to the first shaft, a sensor head having a facing surface and a rear surface in opposing relation disposed on the mounting bracket and extending in a substantially perpendicular orientation with respect to the centerline of the first shaft, a collimated light source mounted on the sensor head for transmitting a beam of energy in a direction that is substantially parallel to the first shaft, and a photosensitive sensor mounted on the sensor head for sensing light and generating a position signal corresponding to a position of a light beam impinging upon the photosensitive sensor, an angular position sensing apparatus comprising:~~

an analyzer having memory,

a mounting bracket having engagement surfaces for engaging the first shaft and securing the bracket to the first shaft,

a sensor head having a facing surface and a rear surface in opposing relation disposed on the mounting bracket and extending in a substantially perpendicular orientation with respect to the centerline of the first shaft,

a collimated light source mounted on the sensor head for transmitting a beam of energy in a direction that is substantially parallel to the first shaft,

a photosensitive sensor mounted on the sensor head for sensing light and generating a position signal corresponding to a position of a light beam impinging upon the photosensitive sensor,

at least one accelerometer mounted on the sensor head for generating a signal corresponding to the angular orientation of the sensor head with respect to the first shaft, and

a microprocessor for processing the signal generated by the at least one accelerometer, operable to provide an output corresponding to the angular position of the sensor head relative to the first shaft.

Claim 12. (currently amended) ~~In an An alignment system for aligning a centerline of a first shaft with a centerline of a second shaft , the shaft alignment system including an analyzer having memory, a mounting bracket having engagement surfaces for engaging the first shaft and securing the bracket to the first shaft, a sensor head having a facing surface and a rear surface in opposing relation disposed on the mounting bracket and extending in a substantially perpendicular orientation with respect to the centerline of the first shaft, a collimated light source mounted on the sensor head for transmitting a beam of energy in a direction that is substantially parallel to the first shaft, and a photosensitive sensor mounted on the sensor head for sensing light and generating a position signal corresponding to a position of a light beam impinging upon the photosensitive sensor, an angular position sensing apparatus comprising:~~

an analyzer having memory,

a mounting bracket having engagement surfaces for engaging the first shaft and securing the bracket to the first shaft,

a sensor head having a facing surface and a rear surface in opposing relation disposed on the mounting bracket and extending in a substantially perpendicular orientation with respect to the centerline of the first shaft,

a collimated light source mounted on the sensor head for transmitting a beam of energy in a direction that is substantially parallel to the first shaft,

a photosensitive sensor mounted on the sensor head for sensing light and generating a position signal corresponding to a position of a light beam impinging upon the photosensitive sensor,

at least one accelerometer for generating a signal corresponding to the angular orientation of the sensor head with respect to the first shaft, and

a microprocessor for processing the signal generated by the at least one accelerometer, wherein the microprocessor further comprises an angle processing module for determining a current head quadrant location and determining the angular position of the sensor head based in part on the quadrant location, the microprocessor providing an output corresponding to the angular position of the sensor head relative to the first shaft.

Claim 13. (currently amended) The angular position sensing apparatus of Claim 12, wherein the at least one accelerometer is a single-axis accelerometer for generating a signal proportional to the angular orientation of the sensor head.

D1
Consider

Claim 14. (currently amended) The angular position sensing apparatus of Claim 12, wherein the at least one accelerometer is a dual-axis accelerometer having a radial and a tangential axis, for generating radial and tangential signals proportional to the angular orientation of the sensor head.

Claim 15. (previously amended) In an alignment system for aligning a centerline of a first shaft with a centerline of a second shaft, the shaft alignment system including an analyzer having memory, a mounting bracket having engagement surfaces for engaging the first shaft and securing the bracket to the first shaft, a sensor head having a facing surface and a rear surface in opposing relation disposed on the mounting bracket and extending in a substantially perpendicular orientation with respect to the centerline of the first shaft, a collimated light source mounted on the sensor head for transmitting a beam of energy in a direction that is substantially parallel to the first shaft, and a photosensitive sensor mounted on the sensor head for sensing light and generating a position signal corresponding to a position of a light beam impinging upon the photosensitive sensor, an angular position sensing apparatus comprising:

a first dual-axis accelerometer having a first sensing axis for sensing a first acceleration component and a second sensing axis for sensing a second acceleration component, wherein the first and second sensing axes are in substantially perpendicular relation, the first dual-axis accelerometer operable to output a first signal proportional to the sensed first acceleration component and to output a second signal proportional to the sensed second acceleration component,

a second dual-axis accelerometer having a third sensing axis for sensing a third acceleration component and a fourth sensing axis for sensing a fourth acceleration component, wherein the third and fourth sensing axes are in substantially perpendicular relation, the second dual-axis accelerometer operable to output a third signal proportional to the sensed third acceleration component and to output a fourth signal proportional to the sensed fourth acceleration component, the first and second dual-axis accelerometers mounted in spaced apart relation defining a plane of reference, and

a microprocessor for processing the signals generated by the first and second dual-axis accelerometers, operable to provide an output corresponding to the angular position of the sensor head relative to the first shaft.

D1
Considered

Claim 16. (original) The apparatus of Claim 15, wherein the microprocessor is operable to determine the angular position of the sensor head as the sensor head rotates through a plurality of angular positions about the first shaft by selecting a fifth signal dependent on the first and third signals or a sixth signal dependent on the second and fourth signals and determining the angular position of the rotatable body therefrom.

Claim 17. (previously amended) The angular position sensing apparatus of Claim 16 wherein the fifth signal corresponds to a first sine wave function and the sixth signal corresponds to a second sine wave function ninety degrees out of phase with respect to the first sine wave function, wherein the microprocessor determines the angular position of the body based on a most linear region of the first or second sine waves.

Claims 18-22 (previously withdrawn).

Claim 23. (previously added) The angular position sensing apparatus of claim 15 further comprising processing features for processing the signals from the first and second dual-axis accelerometers to correct for centrifugal and angular acceleration effects.

Claim 24. (currently amended) In an An alignment system for aligning a first shaft comprising:

a sensor head coupled to the first shaft,
a collimated light source disposed on the sensor head for transmitting an energy beam,
a photosensitive sensor disposed on the sensor head for sensing light and generating a position signal therefrom,

a first dual-axis accelerometer having a first sensing axis for sensing a first acceleration component and a second sensing axis for sensing a second acceleration component, wherein the first and second sensing axes are in substantially perpendicular relation, the first dual-axis accelerometer operable to output a first signal proportional to the sensed first acceleration component and to output a second signal proportional to the sensed second acceleration component, and

a second dual-axis accelerometer having a third sensing axis for sensing a third acceleration component and a fourth sensing axis for sensing a fourth acceleration component, wherein the third and fourth sensing axes are in substantially perpendicular relation, the second dual-axis accelerometer operable to output a third signal proportional to

*D
and*

the sensed third acceleration component and to output a fourth signal proportional to the sensed fourth acceleration component ~~at least one accelerometer disposed on the sensor head for generating a signal corresponding to the angular orientation of the sensor head with respect to the first shaft~~, and

a processor for processing the signals generated by the ~~at least one accelerometer first and second dual-axis accelerometers~~, operable to provide an output corresponding to the angular position of the sensor head relative to the first shaft.

Claim 25 (cancelled).
